

Solution Synopsis & Executive Summary

An AI-powered emergency coordination platform that finds a hospital able to treat the patient right now and gets that hospital to accept the patient before the family leaves home.

☆ MPOne Idea & Innovation Hackathon 2026 🏠 Challenge 5 · AI for Public Services · Healthcare

👤 Team Leader: Prakhar Porwal 🌐 medreach-wtne.onrender.com 📄 github.com/prakharporwal518-collab/Medreach

In an emergency, the nearest hospital is not always the right hospital.

Families rush to the closest hospital only to discover there is no cardiologist on duty, the CT scanner is down or the ICU is full. Then they lose the golden hour driving to a second hospital. Nobody tells them in advance which hospital can actually treat this emergency *now*.

Medreach closes this gap. The citizen speaks in Hindi, English or Hinglish; AI turns the words into medical requirements; a transparent engine matches them to hospitals with staff-verified live capacity; the hospital accepts and prepares a bay; and the patient travels with live navigation.

1 How it works: our flowchart, fully implemented

2 What makes Medreach different

AI understands the emergency

Voice or text in Hindi / English / Hinglish, a photo or a health card becomes structured requirements. Says "may indicate...", never "you have...".

Capability, not distance

The service must exist, the specialist must be on duty and the machine must work now. Only then does distance count.

Freshness you can trust

Every figure shows who updated it and when: green <15 min, amber 15–60 min, red unverified. Stale data never looks confirmed.

Accepted before you travel

A named staff member accepts the referral and assigns a receiving bay. No answer in 60 s → the next suitable hospital is asked automatically.

Transport + live map

Ambulance request or own vehicle, turn-by-turn navigation, live maps on both dashboards and a no-medical-data tracking link for family.

Privacy by design

Consent before sharing, masked ABHA / Ayushman IDs, hospital-only case access, full audit log, automatic deletion 24 h after hand-over.

3 All 7 suggested technologies are used

Technology	In Medreach	Technology	In Medreach
Generative AI	Requirements from free text + SBAR pre-arrival note	Predictive Analytics	Traffic ETA, bed-on-arrival, ER wait, forecast
Voice Bots	Speak in Hindi / English; key steps read aloud	Conversational AI	One follow-up question at a time
Computer Vision	Photo of injury → visible findings	Mobile App	Installable PWA, bilingual, works offline
OCR	Ayushman / ABHA card read on the phone	Live maps	Citizen + hospital, free OpenStreetMap

4 Two portals, one live network

Citizen: live case map, ambulance on the way

Hospital: verified bed / ICU status and referrals

5 Proof and impact

Live Deployed web app, both portals	16 Bhopal-region hospitals in the demo	7 / 7 Technologies implemented	51 Automated tests passing
Citizens Right hospital the first time, bay already prepared, family kept informed.	Hospitals Advance notice, AI pre-arrival note, fewer surprise critical arrivals.	Government Live, audited view of emergency capacity for planning.	

Next steps and demo access

Pilot in Bhopal, then integrate the Health Facility Registry, hospital HMIS, 108 control room and ABDM for state-wide rollout.
