

Prototype, Demo & Proof of Concept

A working, deployed product, not a mock-up. Here is how to try it, what each screen proves, and what is real vs simulated.

☆ MPOne Idea & Innovation Hackathon 2026 🏠 Challenge 5 · AI for Public Services · Healthcare

1 Try it yourself

Open	Link
Home page	https://medreach-wtne.onrender.com
Report an emergency (no login)	https://medreach-wtne.onrender.com/report
Sign in (citizen / hospital staff)	https://medreach-wtne.onrender.com/login
Citizen dashboard	https://medreach-wtne.onrender.com/citizen
Hospital dashboard	https://medreach-wtne.onrender.com/hospital
Source code	https://github.com/prakharporwal518-collab/Medreach

Demo hospital login: Hospital Bansal Hospital · Staff ID BANSAL-ED01 (Emergency Desk Officer) or BANSAL-NO01 (Nodal Officer). The OTP is shown on screen because the prototype has no SMS gateway.

Tip: the free server sleeps when idle; the first visit can take 30–50 seconds. A single offline HTML file of the whole prototype is also in the repository ([demo/medreach-prototype.html](#)).

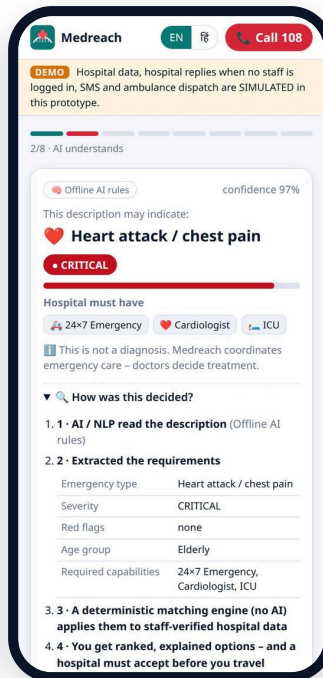

2 3-minute demo script

#	Action	What it proves
1	Staff signs in to the hospital dashboard (Bansal → BANSAL-ED01 → OTP).	Secure staff-only access, verified figures
2	On the phone say: <i>"Papa ko seene mein dard hai, pasina aa raha hai, 62 saal"</i> .	Voice + Hinglish AI understanding
3	App shows <i>may indicate heart attack · CRITICAL · needs cardiologist + ICU</i> ; open "How was this decided?".	Explainable AI → requirements
4	Find hospitals; open "Why this hospital?" and the match score.	Capability matching + freshness
5	On the console set ER to <i>Diverting</i> : the hospital disappears from the phone; set back to <i>Open</i> .	Live data, under one second
6	Ask hospital to accept; staff reads the SBAR note and accepts with bay <i>Resus-02</i> .	Acceptance before travel
7	Request ambulance; watch it move on both live maps; preview the family link.	Transport, live tracking, privacy
8	Open "I'm alone" with a saved contact: all five steps complete by themselves.	Help for people living alone

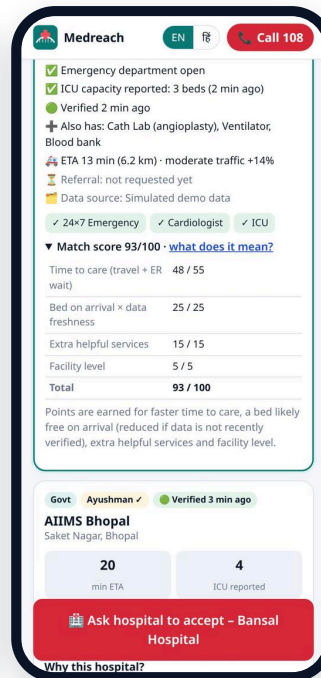

3 Walkthrough: what each screen proves

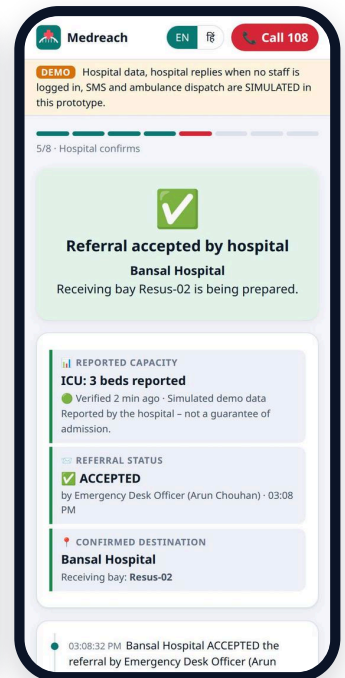

1. Speak or type; quick picks; photo & card scan

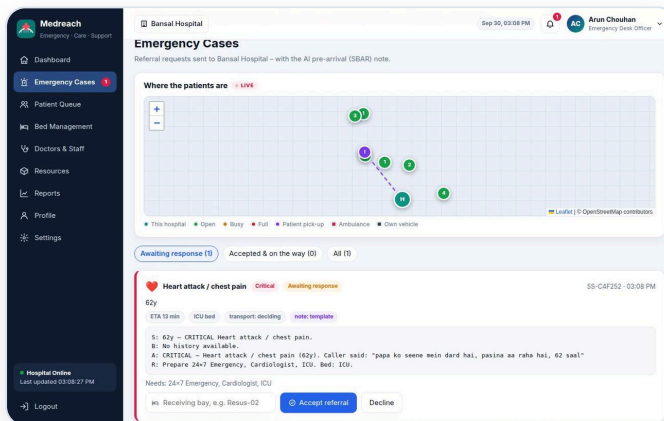

2. AI: may indicate heart attack, CRITICAL

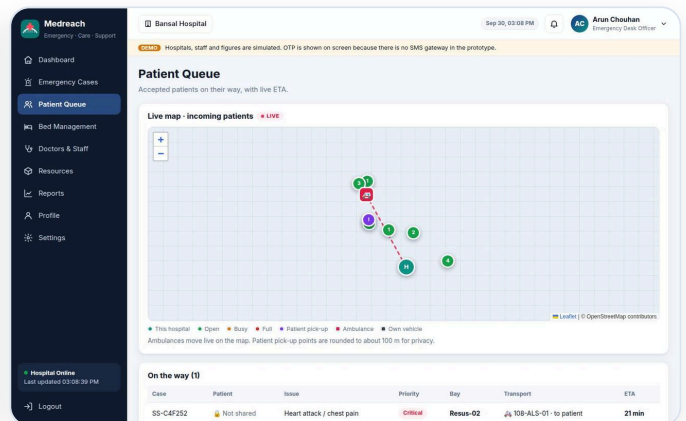

3. "Why this hospital?" + score explained

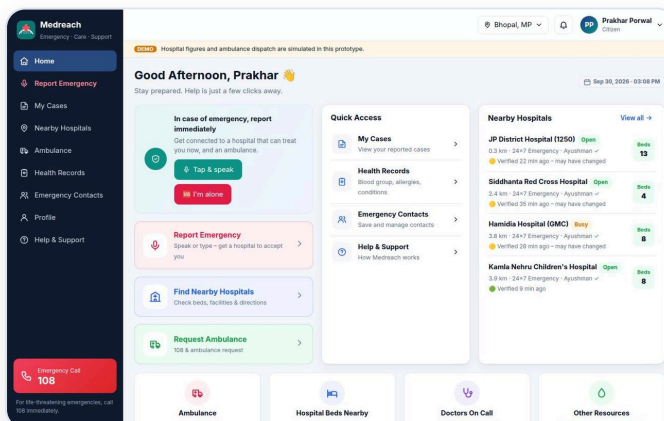

4. Accepted by named officer, bay Resus-02

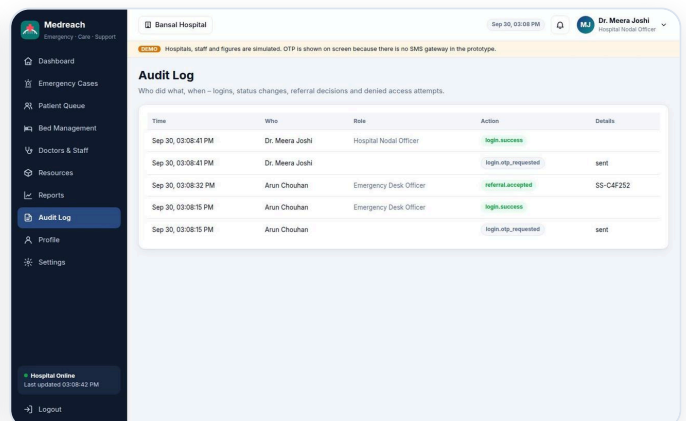

5. Hospital: referral with AI SBAR note, masked identity, accept + bay

6. Hospital: live map of incoming ambulance and ETA

7. Citizen dashboard: one-tap emergency and verified hospital status

8. Nodal officer: audit log of every action

4 What is real and what is simulated

We state this openly, in the app (yellow DEMO banner) and here.

Part	In the prototype (demo mode)	In deployment (live mode)
Hospitals	Real Bhopal-region hospital names, approximate locations	NHA Health Facility Registry / state master
Beds, ER, roster	Simulated values, clearly labelled	Entered by authorised staff or synced from HMIS
Hospital acceptance	Real flow when staff are logged in; simulated desk otherwise	Always a logged-in staff member
Staff OTP	Shown on screen (no SMS gateway)	SMS OTP, never returned by the API
Ambulance	Simulated units and movement	Hand-off to the 108 control room (CAD)
AI	Offline rules engine; Claude when a key is set	Claude, with rules as floor and fallback

5 Evidence the concept works

API keys needed for maps

Tested end to end

- Citizen registration, emergency, acceptance, My Cases update
- Staff login with OTP, roles, audit log
- Privacy: each portal blocks the other
- Live maps move; phone layout at 390 px width

Built to be extended

- Same API code runs on the server and inside the offline demo file
- Clear integration points for HFR, HMIS, 108 CAD, ABDM
- Open repository with README, privacy doc and deploy blueprint

6 Where judges can see each technology in the live demo

Technology	Open this in the demo
Voice Bots	/report → tap the red microphone and speak in Hindi or English; accepted status is read aloud.
Generative / Conversational AI	Describe the emergency → "This may indicate..." card, follow-up question, "How was this decided?"
Computer Vision	Step 1 → "Photo of injury" (wound or burn) → visible findings shown with the result.
OCR	Step 1 → "Scan health card" (Ayushman / ABHA / prescription) → details pre-filled after consent.
Predictive Analytics	Hospital card → ETA with traffic, "bed on arrival" in the score; hospital dashboard → Reports → "Predicted ER arrivals · next 8 hours".
Mobile App	Open on a phone → "Add to Home screen"; switch EN / हि; works with weak or no network.
